

Food Delivery Time Analysis

Data visualization & insights to optimize speed, satisfaction, and fleet performance

Delivery Time Distribution

What the spread tells us

- Most deliveries cluster in a central time range
- Long tail of outliers signals operational friction
- Identify peak vs. off-peak delivery patterns

Age vs. Delivery Time

Customer segment insight

Delivery expectations may vary by age group — understanding these patterns helps tailor service levels and communication.

- Look for age cohorts with consistently longer or shorter delivery windows.

Ratings vs. Delivery Time

Speed and satisfaction are linked — faster deliveries tend to drive higher ratings, but consistency matters most.

Vehicle Type Breakdown

Fleet composition

Each vehicle type serves different distance and density profiles. Understanding the mix helps optimize dispatch logic and zone coverage.

Cars

Longer routes, higher capacity

Motorcycles

Urban agility, faster last-mile

Bicycles

Dense zones, eco-friendly

Order Type Analysis

Order complexity impact

Order type — single item, combo, or group — directly affects prep time and delivery routing. Segment performance by order type to isolate bottlenecks.

Average Delivery Time by Vehicle

Fleet performance benchmark

Compare average delivery times across vehicle types to identify which fleet segments underperform — and why.

 Use this view to guide fleet allocation decisions by zone and time of day.

Average Delivery Time by Order Type

Where delays concentrate

Certain order types consistently take longer. Pinpointing these helps restaurants and dispatchers set accurate ETAs and manage customer expectations.

Distance vs. Delivery Time

The relationship between distance and time reveals routing efficiency — deviations from the trend line highlight optimization opportunities.

Delivery Time Variability – Boxplot

Consistency is the real metric

Outliers and spread reveal which segments have the most unpredictable delivery times — the true driver of customer frustration.

Median

Typical delivery experience

IQR Spread

Consistency across deliveries

Outliers

Extreme delays to investigate
